

Python for Web Developers Learning Journal: Brandon Lopez

Objective

We find that the students who do particularly well in our courses are those who practice metacognition. Metacognition is the art of thinking about thinking; developing a deeper understanding of your own thought processes. With the help of this Learning Journal, you'll broaden your metacognitive knowledge and skills by reflecting on what you learn in this course.

Thanks to this Learning Journal, when you finish the course you'll have a complete and detailed record of your learning journey and progress over time. We really recommend that you take the time to complete this Journal; students do better in CF courses and in the working world as a result!

Directions

First complete the pre-work section before you start your course. Then, once you've begun learning, take time after each Exercise to return to this Journal and respond to the prompts.

There will be 3 to 5 prompts per Exercise, and we recommend spending about 10 to 15 minutes in total answering them. Don't overthink it—just write whatever comes to mind!

Also make sure that, once you've started filling this document in, you upload it as a deliverable on the platform. This is so that your mentor can also see your Journal and how you're progressing over time. Don't worry though—what you write here won't affect how you're graded for the Exercise tasks. The learning journal is mostly for you and your self-evaluation!

Pre-Work: Before You Start the Course

Reflection questions (to complete before your first mentor call)

1. What experiences have you had with coding and/or programming so far? What other experiences (programming-related or not) have you had that may help you as you progress through this course?: **I took a couple courses with python previously, as well as a coding course for Swift and SwiftUI, I also just completed the career foundry Web development section which means I've covered javascript.**
2. What do you know about Python already? What do you want to know?: **I know the general basics, I know the data types, how to create functions, how to implement for and while loops, how to work with strings and read data from another file. I also worked a lot with the pandas framework.**
3. What challenges do you think may come up while you take this course? What will help you face them? Think of specific spaces, people, and times of day of week that might be favorable to your facing challenges and growing. Plan for how to solve challenges that arise.: **The main challenge I had in the last section was using frameworks, and packages that have since been depreciated and so they are no longer supported as fully as I would have liked, so it**

became a little difficult to navigate with newer versions. I also anticipate that as I move forward with python I will encounter pieces that will challenge me since I know that I don't know everything about python. I plan on using the same things I always use to overcome challenges, relying on my family, using chatrooms and forums to get opinions from other developers as well as occasionally using AI when it's necessary to get a little help when stuck.

Remember, you can always refer to [Exercise 1.4](#) of the Orientation course if you're not sure whom to reach out to for help and support.

Exercise 1.1: Getting Started with Python

Learning Goals

- Summarize the uses and benefits of Python for web development
- Prepare your developer environment for programming with Python

Reflection Questions

1. In your own words, what is the difference between frontend and backend web development? If you were hired to work on backend programming for a web application, what kinds of operations would you be working on?: **Frontend is what the user interacts with while backend is mainly sever and API related. I much rather do backend becasue it seems to require more logical coding while frontend is more design elements.**
2. Imagine you're working as a full-stack developer in the near future. Your team is asking for your advice on whether to use JavaScript or Python for a project, and you think Python would be the better choice. How would you explain the similarities and differences between the two languages to your team? Drawing from what you learned in this Exercise, what reasons would you give to convince your team that Python is the better option?

(Hint: refer to the Exercise section "The Benefits of Developing with Python"): ***I would rely on the point that python is more readable, a little easier to write out, has a ton of support, also its a newer language compared to javascript and so it's likely that as languages change and time passes, that python will be used more so in the future as tech stacks change.***

3. Now that you've had an introduction to Python, write down 3 goals you have for yourself and your learning during this Achievement. You can reflect on the following questions if it helps you. What do you want to learn about Python? What do you want to get out of this Achievement? Where or what do you see yourself working on after you complete this Achievement? **Goal 1: To become better versed in python. Goal 2: (I know it's a little difficult and maybe even silly) but I**

always wanted to be able to code out backend code without having to read documentation or rely on things like stack overflow or AI. I want to just be able to type and write out what I need the same way I would write a paper or essay. Goal 3: Learn enough to not feel this overwhelming imposter syndrome, to feel like I actually know what I'm doing.

Exercise 1.2: Data Types in Python

Learning Goals

- Explain variables and data types in Python
- Summarize the use of objects in Python
- Create a data structure for your Recipe app

Reflection Questions

1. Imagine you're having a conversation with a future colleague about whether to use the iPython Shell instead of Python's default shell. What reasons would you give to explain the benefits of using the iPython Shell over the default one?: **Readability, the fact that python has more color makes it easier to read, the fact that the output is very much clearer makes it easier to debug, and it seems much more intuitive.**
2. Python has a host of different data types that allow you to store and organize information. List 4 examples of data types that Python recognizes, briefly define them, and indicate whether they are scalar or non-scalar.

Data type	Definition	Scalar or Non-Scalar?
Integer	Represents whole numbers, positive or negative, without decimals.	Scalar
Float	Represents real numbers with decimal points	Scalar
List	An ordered collection of elements which can be of different data types	Non-Scalar
Dictionary	A collection of key-value pairs where each key must have a corresponding value	Non-Scalar

3. A frequent question at job interviews for Python developers is: what is the difference between lists and tuples in Python? Write down how you would respond.: **Tuples are immutable meaning once created elements cannot be changed, while lists are mutable . Tuples are defined with parentheses while lists are defined with square brackets. Also lists are much slower**

due to their dynamic nature, while tuples tend to be faster since they are immutable making them more memory-efficient.

4. In the task for this Exercise, you decided what you thought was the most suitable data structure for storing all the information for a recipe. Now, imagine you're creating a language-learning app that helps users memorize vocabulary through flashcards. Users can input vocabulary words, definitions, and their category (noun, verb, etc.) into the flashcards. They can then quiz themselves by flipping through the flashcards. Think about the necessary data types and what would be the most suitable data structure for this language-learning app. Between tuples, lists, and dictionaries, which would you choose? Think about their respective advantages and limitations, and where flexibility might be useful if you were to continue developing the language-learning app beyond vocabulary memorization.

I would choose a dictionary because we're storing larger amounts of data and because it's built around key value pairs, each word is going to have a corresponding definition just the way each key needs a corresponding value.

Exercise 1.3: Functions and Other Operations in Python

Learning Goals

- Implement conditional statements in Python to determine program flow
- Use loops to reduce time and effort in Python programming
- Write functions to organize Python code

Reflection Questions

1. In this Exercise, you learned how to use **if-elif-else** statements to run different tasks based on conditions that you define. Now practice that skill by writing a script for a simple travel app using an **if-elif-else** statement for the following situation:
 - The script should ask the user where they want to travel.
 - The user's input should be checked for 3 different travel destinations that you define.
 - If the user's input is one of those 3 destinations, the following statement should be printed: "Enjoy your stay in _____!"
 - If the user's input is something other than the defined destinations, the following statement should be printed: "Oops, that destination is not currently available."

Write your script here. (*Hint: remember what you learned about indents!*)

```
destination = input("Where would you like to travel? ")

defined_destinations = ["Paris", "Tokyo", "New York"]

if destination == "Paris":
    print("Enjoy your stay in Paris!")
elif destination == "Tokyo":
    print("Enjoy your stay in Tokyo!")
elif destination == "New York":
    print("Enjoy your stay in New York!")
else:
    print("Oops, that destination is not currently available.")
```

2. Imagine you're at a job interview for a Python developer role. The interviewer says "Explain logical operators in Python". Draft how you would respond.: **Logical operators are "And", "Or" and "Not" they allow you to compare and link together multiple expressions to determine their truth value.**
3. What are functions in Python? When and why are they useful?: **Functions are useful because they allow you to group together lines of code and call it at a later time without having to retype out every single line every time you want to perform the same actions.**
4. In the section for Exercise 1 in this Learning Journal, you were asked in question 3 to set some goals for yourself while you complete this course. In preparation for your next mentor call, make some notes on how you've progressed towards your goals so far.

Exercise 1.4: File Handling in Python

Learning Goals

- Use files to store and retrieve data in Python

Reflection Questions

1. Why is file storage important when you're using Python? What would happen if you didn't store local files?: **If you don't store the files, then once the program ends the data is lost, file storage is important so that once the program ends, all the data that was accumulated during run time is still there for use at a later date.**
2. In this Exercise you learned about the pickling process with the `pickle.dump()` method. What are pickles? In which situations would you choose to use pickles and why?: **You would use pickles when you want to load or read data as a binary file. This would be to include more data such as dictionaries, since normal files would not be read with the same detail, therefore it would not be organized as well.**
3. In Python, what function do you use to find out which directory you're currently in? What if you wanted to change your current working directory?: **You would use the "os" module. Specifically the `os.getcwd()` command. It would show you where you are and so you have a better idea to correct the path of your data.**
4. Imagine you're working on a Python script and are worried there may be an error in a block of code. How would you approach the situation to prevent the entire script from terminating due to an error?: **You could wrap the block in a try-except block. This would allow you to try one piece of code, and if an error shows up, instead of the code crashing it would simply print the lines of code that you write within your except block.**

5. You're now more than halfway through Achievement 1! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? Feel free to use these notes to guide your next mentor call. : **Although I was able to complete the assignment, I did have to go back and forth from the reading quite a lot meaning I could used a little more practice with opening files. Other than that, I have always enjoyed python becasue for some reason it makes sense to me, and it comes very much naturally to me.**

Exercise 1.5: Object-Oriented Programming in Python

Learning Goals

- Apply object-oriented programming concepts to your Recipe app

Reflection Questions

1. In your own words, what is object-oriented programming? What are the benefits of OOP?:
Object-Oriented programming is a way to code that organizes code into objects which can group data and methods together. The benefits are this makes coding more modular, reusable and easier to manage.
2. What are objects and classes in Python? Come up with a real-world example to illustrate how objects and classes work.: **A class is a blueprint for creating objects, it defines variables and functions that describe an entire entity. An Object is an instance of a class, it has its own values but still follow the structure created by the class. A good example would be a library of books. The book class would have a structure, what year it was published, the title, an image, and an author. Each book (object) would have its own values, but it still follows the guidelines set by the original book (class).**
3. In your own words, write brief explanations of the following OOP concepts; 100 to 200 words per method is fine.

Method	Description
Inheritance	Is a concept where a child class derives attributes and methods from a parent class. This promotes code reuse, avoids redundancy and creates hierarchy between classes. For example a parent class, would be something like Animal. Animals have qualities such as names, ages, and heights. A Dog (child class) being that it is an animal will inherit all those qualities but also has its own quality, the ability to bark. So that will be something that will be added specifically to dog, even though it inherited other qualities from its parent class (Animal)

Polymorphism	Is a concept where the same method or function behaves differently based on the object calling it, for example you can have two different functions in two different classes that have the same name but can function completely differently. This is because what is defined in one class may not be the same way the method is defined in the second class. This allows you to keep unified naming but have the functions do what you need them to do in any
Operator Overloading	This allows operations like +, -, *, / to be redefined for user-defined classes. This allows objects to interact using standard operators while keeping class specific behavior. By customizing operator behavior, developers can create more expressive and natural interactions between objects, making the code easier to understand and maintain in real-world applications.

Exercise 1.6: Connecting to Databases in Python

Learning Goals

- Create a MySQL database for your Recipe app

Reflection Questions

1. What are databases and what are the advantages of using them?

Databases are great for storing data that you can access at a later point in time. This is helpful when storing things like recipes in this last exercise because it isn't stored within the program itself, which will help it to run faster.

2. List 3 data types that can be used in MySQL and describe them briefly:

Data type	Definition
Int	This would be an integer value, a number
Varchar	This would be a string or character value
Date	This would be a date, to store yyy-mm-dd

3. In what situations would SQLite be a better choice than MySQL?

SQLite would be a better choice for smaller lightweight applications, and for prototyping where the load put onto the database is much lighter.

4. Think back to what you learned in the Immersion course. What do you think about the differences between JavaScript and Python as programming languages?

Just based on use, I find Python to be a lot easier especially in regards to implementing databases. I find Python to be easier with syntax and find it to be a more capable language just based on how we've been using it so far.

5. Now that you're nearly at the end of Achievement 1, consider what you know about Python so far. What would you say are the limitations of Python as a programming language?

So far I'm not entirely sure what the limitations are. I feel that python can be used for anything, I know there are companies that use it for a lot of different things and I know that it seems to be a lot easier with implementing different things like databases and classes. The only thing I can figure is that it might not be easy to implement different languages with it like HTML like javascript does.

Exercise 1.7: Finalizing Your Python Program

Learning Goals

- Interact with a database using an object-relational mapper
- Build your final command-line Recipe application

Reflection Questions

1. What is an Object Relational Mapper and what are the advantages of using one?

It integrates easier with python and is more readable than using the SQL syntax.

2. By this point, you've finished creating your Recipe app. How did it go? What's something in the app that you did well with? If you were to start over, what's something about your app that you would change or improve?

It went well, the only thing I would consider adding would be adding a loop for re-editing incase the user messes up instead of kicking them out of the function.

3. Imagine you're at a job interview. You're asked what experience you have creating an app using Python. Taking your work for this Achievement as an example, draft how you would respond to this question.

I have experience in programing a python terminal program from scratch that can give a user multiple ways to add and edit recipes into a database for later use. I'm familiar with the python frameworks as well as the SQL databases and how to use SQLAlchemy to add edit and change the data within my database.

4. You've finished Achievement 1! Before moving on to Achievement 2, take a moment to reflect on your learning in the course so far:

a. What went well during this Achievement?

I think my learning in this achievement went smooth, I did have prior python experience which helped me through.

b. What's something you're proud of?

I'm actually very proud of this final achievement project because I felt that it brought everything together, and although it was challenging I was able to make my way through it.

c. What was the most challenging aspect of this Achievement?

By far the SQL lesson before ORM was my most difficult lesson to grasp.

d. Did this Achievement meet your expectations? Did it give you the confidence to start working with your new Python skills?

This definitely gave me more confidence as far as working with python, I'm excited to see what I learn next

e. What's something you want to keep in mind to help you do your best in Achievement 2?

I have to remember to keep my code simple for readability and to make sure I'm commenting through my code.

Well done—you've now completed the Learning Journal for Achievement 1. As you'll have seen, a little metacognition can go a long way!

Pre-Work: Before You Start Achievement 2

In the final part of the learning journal for Achievement 1, you were asked if there's anything—on reflection—that you'd keep in mind and do similarly or differently during Achievement 2. Think about these questions again:

- Was your study routine effective during Achievement 1? If not, what will you do differently during Achievement 2?

I didn't really have a study routine, in Achievement 2 I want to just power through it so I can retain more information and so I'll have to look back less.

- Reflect on your learning and project work for Achievement 1. What were you most proud of? How will you repeat or build on this in Achievement 2?

I'm most proud of the final project. I think that in Achievement 2 I want to continue learning as much as I can about python because I am really enjoying it.

- What difficulties did you encounter in the last Achievement? How did you deal with them? How could this experience prepare you for difficulties in Achievement 2?

A couple difficulties I encountered were in the beginning with installing the virtual environments but that's because they have newer versions of everything so some of the things we're told to download are depreciated.

Note down your answers and discuss them with your mentor in a call if you like.

Remember that can always refer to [Exercise 1.4](#) of the Orientation course if you're not sure whom to reach out to for help and support.

Exercise 2.1: Getting Started with Django

Learning Goals

- Explain MVT architecture and compare it with MVC
- Summarize Django's benefits and drawbacks
- Install and get started with Django

Reflection Questions

1. Suppose you're a web developer in a company and need to decide if you'll use vanilla (plain) Python for a project, or a framework like Django instead. What are the advantages and drawbacks of each?

The drawbacks are that Django is not good for simple basic web apps, so if I were going to suggest using it, I would have to keep scalability in mind and see how bi I can make the project without losing focus of what the goal is.

2. In your own words, what is the most significant advantage of Model View Template (MVT) architecture over Model View Controller (MVC) architecture?

I would still like to use it before I make any final decisions but so far it seems like an easier model because some of the developer work is already done by Django.

3. Now that you've had an introduction to the Django framework, write down three goals you have for yourself and your learning process during this Achievement. You can reflect on the following questions if it helps:
 - What do you want to learn about Django?
 - What do you want to get out of this Achievement?
 - Where or what do you see yourself working on after you complete this Achievement?

I want to learn how to create a web-app quickly and efficiently. I would like to, by the end of this achievement be able to use Django fluently, and be able to create web-apps that future employers will admire. After I complete this achievement, I see myself working on a major portfolio piece, I haven't quite decided what it is but I do want something that I can scale up as I grow as a developer.

Exercise 2.2: Django Project Set Up

Learning Goals

- Describe the basic structure of a Django project
- Summarize the difference between projects and apps
- Create a Django project and run it locally
- Create a superuser for a Django web application

Reflection Questions

1. Suppose you're in an interview. The interviewer gives you their company's website as an example, asking you to convert the website and its different parts into Django terms. How would you proceed? For this question, you can think about your dream company and look at their website for reference.

(Hint: In the Exercise, you saw the example of the CareerFoundry website in the Project and Apps section.)

So for the example of the career foundry website, the website as a whole, would be looked at as the project. After that each section such as the login the dashboard, the learning tab, the different class sections would all be considered apps. Each app can be used in other projects if needed, such as the login app. That can be used in the career foundry project, it can also be used in other projects that require logins as well. This principle can be applied with any of the apps within the project.

2. In your own words, describe the steps you would take to deploy a basic Django application locally on your system.

To deploy a basic Django project. First you need to start by creating the folder with Django-admin start project <project name>. Then you need to change to the src folder, and migrate by typing python manage.py migrate. After That you could create a superuser by using python manage.py createsuperuser. This will then prompt you to use a username, email(optional) and password. Once that's done, you have successfully deployed a basic django application.

3. Do some research about the Django admin site and write down how you'd use it during your web application development.

You can use the Django admin site from what it looks like, to add users to your site, and groups as well. This seems like a way to get not only yourself but teams to be able to make changes to your site, so say if you were working with a development team, or multiple teams to create a project, this seems like where you would grant administrative access so each team can work on their prospective portion of the django application.

Exercise 2.3: Django Models

Learning Goals

- Discuss Django models, the “M” part of Django’s MVT architecture
- Create apps and models representing different parts of your web application
- Write and run automated tests

Reflection Questions

1. Do some research on Django models. In your own words, write down how Django models work and what their benefits are.
2. In your own words, explain why it is crucial to write test cases from the beginning of a project. You can take an example project to explain your answer.

Exercise 2.4: Django Views and Templates

Learning Goals

- Summarize the process of creating views, templates, and URLs
- Explain how the “V” and “T” parts of MVT architecture work
- Create a frontend page for your web application

Reflection Questions

1. Do some research on Django views. In your own words, use an example to explain how Django views work.
2. Imagine you’re working on a Django web development project, and you anticipate that you’ll have to reuse lots of code in various parts of the project. In this scenario, will you use Django function-based views or class-based views, and why?
3. Read Django’s documentation on the Django template language and make some notes on its basics.

Exercise 2.5: Django MVT Revisited

Learning Goals

- Add images to the model and display them on the frontend of your application

- Create complex views with access to the model
- Display records with views and templates

Reflection Questions

1. In your own words, explain Django static files and how Django handles them.
2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	
DetailView	

3. You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? You can use these notes to guide your next mentor call.

Exercise 2.6: User Authentication in Django

Learning Goals

- Create authentication for your web application
- Use GET and POST methods
- Password protect your web application's views

Reflection Questions

1. In your own words, write down the importance of incorporating authentication into an application. You can take an example application to explain your answer.
2. In your own words, explain the steps you should take to create a login for your Django web application.

3. Look up the following three Django functions on Django's official documentation and/or other trusted sources and write a brief description of each.

Function	Description
authenticate()	
redirect()	
include()	

Exercise 2.7: Data Analysis and Visualization in Django

Learning Goals

- Work on elements of two-way communication like creating forms and buttons
- Implement search and visualization (reports/charts) features
- Use QuerySet API, DataFrames (with pandas), and plotting libraries (with matplotlib)

Reflection Questions

1. Consider your favorite website/application (you can also take CareerFoundry). Think about the various data that your favorite website/application collects. Write down how analyzing the collected data could help the website/application.
2. Read the Django [official documentation on QuerySet API](#). Note down the different ways in which you can evaluate a QuerySet.
3. In the Exercise, you converted your QuerySet to DataFrame. Now do some research on the advantages and disadvantages of QuerySet and DataFrame, and explain the ways in which DataFrame is better for data processing.

Exercise 2.8: Deploying a Django Project

Learning Goals

- Enhance user experience and look and feel of your web application using CSS and JS
- Deploy your Django web application on a web server
- Curate project deliverables for your portfolio

Reflection Questions

1. Explain how you can use CSS and JavaScript in your Django web application.
2. In your own words, explain the steps you'd need to take to deploy your Django web application.
3. (Optional) Connect with a few Django web developers through LinkedIn or any other network. Ask them for their tips on creating a portfolio to showcase Python programming and Django skills. Think about which tips could help you improve your portfolio.
4. You've now finished Achievement 2 and, with it, the whole course! Take a moment to reflect on your learning:
 - a. What went well during this Achievement?
 - b. What's something you're proud of?
 - c. What was the most challenging aspect of this Achievement?
 - d. Did this Achievement meet your expectations? Did it give you the confidence to start working with your new Django skills?

Well done—you've now completed the Learning Journal for the whole course.
