### **Exercise 1.1**

In this exercise I learned how to install virtualenvwrapper to my computer and I learned how to run a python program through a virtual environment. It was a little tricky especially with installing an outdated version of python but I was able to eventually figure it out. In the courses to come I am hoping to learn how to integrate python into web development, my python experience has been limited to just writing programs on my machine, but being able to mix python with what I've learned already would be amazing. Python is one of my favorite languages and I have always enjoyed working with it. That being said I'm excited to see what comes next in this portion of the class.

### **Exercise 1.2**

In this section we went over the data types, lists tuples, dictionaries, all things that are very useful in the python language. I enjoyed this section because while working on Javascript for the full stack immersion, I had not been using python for a while, so it was nice to have a bit of a refresher as to what the different object classes were and how to use them. I'm looking forward to more time behind the keyboard and working with python further. I can see why the different object classes can come in handy, each one has its own purpose and uses and it is very exciting to be able to re-learn them.
